

ABSTRACT

A soap device includes a sheet of flexible netting-like material having a number of perforations and an outer peripheral portion, and a soap material is engaged into the perforations of the sheet of

5 flexible netting-like material, and engaged onto the outer peripheral portion of the sheet of flexible netting-like material to form the soap device. One or more further sheets of flexible netting-like material may further be engaged into the soap material and superposed with the other sheets of flexible netting-like material. The flexible

10 netting-like sheets may be formed into different roughness or coarseness.
